

Random Forest Hyperparameters

1) Random Forest classifier Hyp. mtrs.

1. Num Estimators

This parameter decides the number of trees in the forest.

2. Max Features

This parameter decides the number of features to consider when looking for the best split.

3) Bootstrap

Whether sampling is random or not

4) Max samples

If bootstrap is true, the number of

samples to draw from X to train each base estimator.

Hyperparameters for Regression are also almost same as classification.
